

MUSLIMHACKS 2026 · ELDERLY CARE

أمانة

Amanah

A trust placed in your hands.

Amanah Care. A private record for the family that looks after a parent.

"My Lord, have mercy upon them as they brought me up when I was small."

QUR'AN 17:24

Every one of us will carry this trust. Most of us will carry it with our brothers and sisters, on our phones, between a job and children of our own.

Ammi is 78.

Fatima · 07:52

did she take the morning ones?

Sister A · 08:10

yes. she ate half. who has her this afternoon?

Abdullah · 08:41

I thought Fatima. I have the pharmacy at 11 I think?

Fatima · 09:15

no that was last week. what did Dr Rahman say
wednesday??

Sister A · 09:20

scroll up

Three children. Three phones. One group chat.
Nobody knows what she took this morning.
Nobody knows who has her this afternoon.
And a company in California keeps her health
history.

1 in 4

American Muslims already care for an older adult. Twice the rate of the general public.

ISPU, Support and Sacrifice, 2026

1 in 4

family caregivers say they cannot coordinate the care. Up from 1 in 5 five years earlier.

AARP / NAC, Caregiving in the U.S., 2020

Not a niche. This is us at forty, with children at home. 52% of Muslims aged 30 to 49 are doing it right now.

So we gave her a record.

Plan

Her day, written once. Morning meds at 8. Dhuhr. The walk after Asr. Night meds at 9, Fatima. Every day becomes a checklist.

Log

Two taps. Ate half. Meds given. Tired. Everyone in the family sees it the second it happens, on their own phone.

Hand off

When you leave, the card writes itself: what happened, what is next. The next person knows. Nothing falls through.

And the record shows who carried the week, so nobody carries it alone.

WHEN THE AMBULANCE COMES

The first ten minutes are questions the family cannot answer.

What did she take, and when. When did she stop eating. When did the confusion start. Her allergies. Her doctor.

One tap

Fourteen days on one page. Medication by day, meals, mood, appointments, contacts. Printed from the phone. Nothing inferred.

Emergency

Every phone in the family lights up, and the sheet opens. Ammi has her own button: I need help.

She is not the user. She is the reason.

Her own screen, in big type. Who is with her today.
What is coming. Her prayers. Who can read her record.

Her preferences ride on every handoff: Urdu, soft halal
food, a woman for personal care. Not a setting. Her
wishes.

One button. I need help.

SATURDAY, SEPTEMBER 6

Assalamu alaykum, Ammi

Fatima is looking after you today. **Abdullah** is coming next.

Night meds

Dhuhr ✓

Asr ✓

Maghrib

I need help

Who can read your record: Sister A, Abdullah, Fatima.
Nobody else.

Her health is not a product.

The key is made on the phone. It never leaves.

The server keeps scrambled text. Not even we can read it.

Tap **Server view** on any screen and see what we see: who, what kind, when. Not one word.

A test proves it: a note written in the app appears in no database row, no stream entry, no response. 96 tests, 99.8% line coverage. Redis Streams, Postgres, Docker. No framework. No cloud AI.

What it is not.

Not a chat

A record. Nothing to scroll up for. Nothing forwarded to a cousin by mistake.

Not a doctor

It never diagnoses, doses or triages. Patterns are counts: "agitated on 3 of the last 7 evenings." The family and the doctor decide what that means.

Not an AI

No model in the loop. When AI comes, it runs on the phone, opt in, and the server still reads nothing.

Not finished

Support workers share the family key for now. No key recovery yet. No Urdu screen yet. Designed, on the roadmap, not hidden.

We would rather be exact than impressive.

Care was already happening.
Now it has a record.
And only the family can read it.

Monday

Five Montreal families, one month. Then scoped keys for support workers, push, Urdu and Arabic on Ammi's screen.

Who pays

Families, never. Home-care agencies and community programs, per elder, for handoff logs and scoped access.

We ask

Introductions to community care programs. Five families. A designer for her screen.
